

Introduction

The iPhone has a built-in GPS sensor and internet connection. This makes it an ideal tool for performing GPS tracking. The “SkiTrails Tracker” app runs on any iPhone running iOS 6.1 or higher. The app is free to download and install, and simple to use.

Installing the app

To install the app, search the iTunes App Store for “SkiTrails Tracker”.

1. Open up the App Store on your iPhone

2. Use the search function to find the “SkiTrails Tracker” app. Hit the install button to get the app.

Using the app

The app has a single screen. Hit the green "START" button to begin tracking, it will change to a red "STOP" button to stop tracking. A green line will show your tracked path. The app automatically uploads the track to the SkiTrails system every 30 seconds. If you do not have an internet connection, it will save data until a connection can be made.

Linking the tracker to your account

Each tracker has a unique serial number. This number must be linked to your SkiTrails account before any data from the tracking devices will appear on your maps. Access the "Devices" page on the SkiTrails management portal

Click "Devices"

Enter serial number and click "Add device"

GPS traces from linked devices will begin show up on your map after a few minutes.
