

## Take the pain out of preparing your trail report

Using GPS, satellite, and cellular technology, SkiTrails tracks where your groomers go and continuously updates your trail report while your groomers work. By the time your groomers are done, the report is already complete.

## More accurate

Forgot where you went? Tired at the end of a long grooming shift? New grooming staff who don't know the trails yet? The GPS system records position data every few seconds, keeping an accurate record of when and where your groomers are operating. No more bleary eyed groomers ticking boxes on forms; the report can show down to the minute when a trail was last groomed.

## Automatic updating

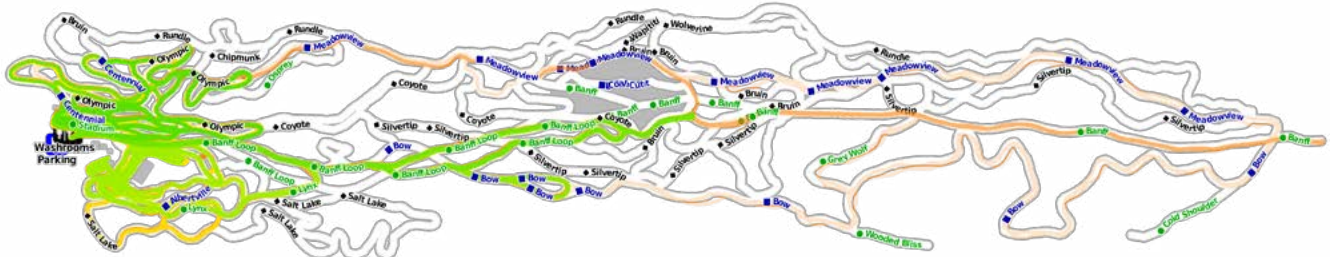

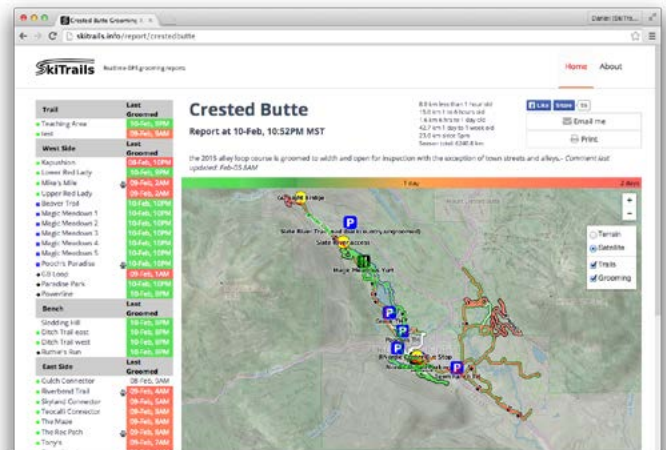

By sending GPS track data to the SkiTrails system via cellular or satellite data links, the trail report is updated continuously, while your groomers are working.

The SkiTrails satellite tracker on a Pisten Bully 100

## Key Features

- Fully automated operation, with near real-time report updates
- Tracking options for small and large equipment
- Customizable printouts for noticeboards
- TV formatted report view for in-lodge display
- Map and report embedding for your own website
- Tools for manual updates, creating and editing your map
- Mobile/smartphone application options

Automatically updated, color coded maps

## Tracking hardware

There are several tracking options to cover most situations. Cellular tracking options are lower cost, satellite tracking equipment works in all locations.

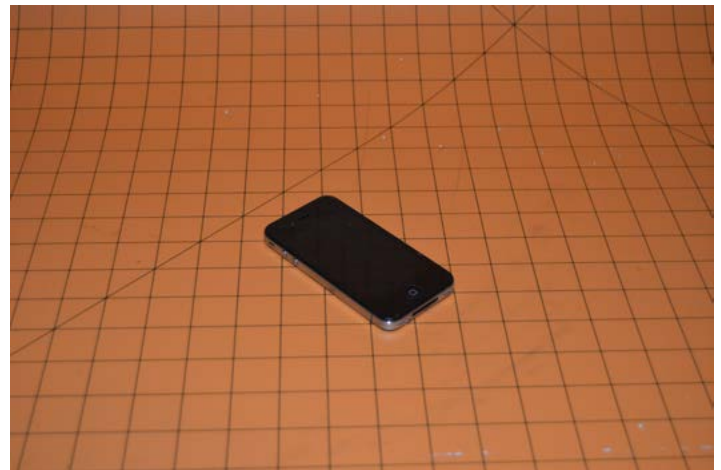

Satellite tracking unit, with pole/bar mounting bracket for use on large machines (Pisten Bully, Prinoth, etc)

Cellular tracking unit, for use on small or large grooming machines. Lower cost, requires cell/mobile coverage.

Satellite tracking unit in rugged case, for use on snowmobile grooming equipment.

Using the SkiTrails Tracker app, you can also use an iPhone to track grooming operations.
